

Discussion: Primary and Secondary Research

Discussion Post

As you begin to look for research that you can use to solve the problem in your research summary for Project 3, it's important you understand the difference between primary and secondary research. First read this article: <https://www.formpl.us/blog/primary-secondary-research>

Deliverable

Compose a discussion post that includes each of the following:

1. Links or screenshots of three examples of primary research.
 - Look for parts of the article or report where the author/researcher explains their methods, data collection, etc.
2. Short descriptions for each example that states how you knew it was primary research.
3. Links or screenshots of three examples of secondary research.
 - Secondary research means that the author did not conduct the research themselves, so likely they will reference where they are pulling their data or information from.
4. Short descriptions for each example that states how you knew it was secondary research.

After you have posted your response, look at your peers' postings. Respond to at least two posts identifying whether you agree with categories they have provided and why or why not.
