Using Visualization Creation Applications

This exercise asks you to learn to use a tool that creates data visualizations. You will familiarize yourself with the tool's basic functions and create a tutorial document (using screenshots or video) that you can share with your peers. The goal is to practice using visualization creation applications, and to teach each other so that everyone can choose one that works for them.

You can select any application you wish that creates graphics/visuals--this includes ones with which you already are familiar. Or you can choose from the following list:

- Canva
- Piktochart
- SimpleDiagrams
- Word
- Excel
- Google Draw

Once you have selected your application/tool, go learn how to use it. As you do, take screenshots or make a video describing the following functions:

- Registering (or getting access)/cost/making a profile
- Selecting a format/template
- Making the visualizations
- Exporting/saving the visualization for use in other documents

After you have made your tutorial document/video, post it to the discussion board to share with your peers and review their tutorials, so you can make an informed decision about with application you would like to use.
